

If each square represents 20 days, each printed sheet of 2000 squares represents 40,000 days. Based on a 300-day working year, we would need 1500 sheets of paper, each with 2000 squares, to visualize how many years it would take to earn the amount owed to the king ($300 \text{ days} \times 200,000 \text{ years} = 60,000,000 \text{ days} \div 40,000 \text{ days/page} = 1500 \text{ pages}$).

Each square represents 20 days, and five squares equal how much the servant was unwilling to forgive his fellow servant.
Compare this to the other page x 1500.
